

PASHUSETU: VETERINARY TRIAGE SUMMARY

AI-Assisted Bovine Disease Assessment & Triage

Owner / Farmer:	Ramesh Kumar	Cattle Tag / ID:	#1205
Assessment Date:	17 Aug 2026, 01:26 PM	Language:	English

Clinical Assessment & First-Aid Guidelines

[Obs] 1. Verification & Clinical Observations

- Confirmation: The image clearly depicts cattle (bovine livestock), specifically a Zebu-type breed characterized by a hump and dewlap.
- Physical Lesions: The animal exhibits a generalized eruption of numerous, discrete nodules and nodular lesions scattered across the entire body, including the neck, flank, and legs.
- Lesion Characteristics: The spots vary in size. Many appear as raised, firm bumps (nodules), while others appear darker, suggesting necrosis (tissue death) or scabbing. The distribution is widespread and not localized to one area.

[Dx] 2. Suspected Condition & Confidence

- Disease Name: Lumpy Skin Disease (LSD)
- Confidence Level: High

[Markers] 3. Diagnostic Markers

- Nodular Eruption: The primary marker is the presence of firm, discrete nodules on the skin, which is the hallmark clinical sign of Lumpy Skin Disease.
- Generalized Distribution: The lesions are not confined to one spot but are spread over the neck, body, and limbs.
- Necrotic Centers: Some of the darker spots indicate that the nodules may be undergoing necrosis or have already scabbed over, which is typical in the progression of the disease.

[Care] 4. Immediate First-Aid & Farm Management

- Strict Quarantine: Immediately isolate the affected animal from the rest of the herd. Lumpy Skin Disease is highly contagious and can spread rapidly through insect vectors (mosquitoes, stable flies) and direct contact.
- Vector Control: Apply insecticides to the animal and the surrounding environment to reduce the population of biting insects that transmit the virus.
- Supportive Care: Keep the animal in a cool, shaded area to reduce stress. Ensure access to clean water and nutritious feed.
- Hygiene: Disinfect the area where the animal is kept. Avoid moving the animal to other farms or markets.
- Veterinary Consultation: Contact a local veterinarian immediately for confirmation and to prescribe appropriate antibiotics (to prevent secondary bacterial infections) and anti-inflammatory drugs.
