

PASHUSETU: VETERINARY TRIAGE SUMMARY

AI-Assisted Bovine Disease Assessment & Triage

Owner / Farmer:	Prathamesh Malokar	Cattle Tag / ID:	#COW-1445
Assessment Date:	16 Aug 2026, 10:31 PM	Language:	English

Clinical Assessment & First-Aid Guidelines

[Obs] 1. Verification & Clinical Observations

- Subject Confirmation: The image clearly shows a bovine animal (cattle), appearing to be a white Zebu or similar breed characterized by a hump and dewlap.
- Physical Lesions: The most prominent observation is the presence of numerous raised, firm nodules (lumps) scattered across the skin, particularly visible on the flank, neck, and legs. The skin texture appears rough and thickened.
- General Condition: The animal is standing on a paved road. The coat appears somewhat matted. While specific mouth ulcers are not clearly visible from this side profile, the skin condition is the primary indicator.

[Dx] 2. Suspected Condition & Confidence

- Disease Name: Lumpy Skin Disease (LSD)
- Confidence Level: High

[Markers] 3. Diagnostic Markers

- Nodular Skin Eruptions: The defining visual marker is the presence of multiple, discrete, raised nodules on the skin surface. These are characteristic of the poxvirus infection associated with LSD.
- Skin Texture: The skin looks uneven and "lumpy" rather than smooth.
- Distribution: The lesions appear widespread across the visible body parts (flank, neck, legs).

[Care] 4. Immediate First-Aid & Farm Management

- Quarantine: Immediately isolate this animal from the rest of the herd. Lumpy Skin Disease is highly contagious and

spreads via vectors (flies, mosquitoes) and direct contact.

- Hygiene: Disinfect the area where the animal is standing. Wear protective gear (gloves, boots) when handling the animal to prevent spreading the virus.
- Topical Care: If any lesions are open or oozing, apply a mild antiseptic solution (like povidone-iodine) to prevent secondary bacterial infections.
- Supportive Care: Ensure the animal has access to clean water and soft, palatable feed, as mouth ulcers (common in LSD) can make eating difficult.
- Veterinary Consultation: Contact a local veterinarian immediately for confirmation and appropriate treatment (e.g., antibiotics for secondary infections, NSAIDs for fever and pain).
