

PASHUSETU: VETERINARY TRIAGE SUMMARY

AI-Assisted Bovine Disease Assessment & Triage

Owner / Farmer:	Ramesh Kumar	Cattle Tag / ID:	#COW -145
Assessment Date:	17 Aug 2026, 12:01 PM	Language:	English

Clinical Assessment & First-Aid Guidelines

[Obs] 1. Verification & Clinical Observations

- Confirmation: The image clearly depicts a bovine animal (cattle), likely a Zebu breed given the visible hump.
- Physical Lesions: The most striking observation is the presence of numerous, widespread nodules (lumps) covering the animal's skin. These lesions are visible on the neck, flank, and legs. They appear as raised, firm, round bumps of varying sizes. Some lesions appear to have central scabbing or necrosis, which is typical as the disease progresses. The skin texture looks rough and uneven due to these proliferations.

[Dx] 2. Suspected Condition & Confidence

- Disease Name: Lumpy Skin Disease (LSD)
- Confidence Level: High

[Markers] 3. Diagnostic Markers

- Generalized Nodules: The primary marker is the presence of multiple, discrete, firm nodules distributed across the entire body surface.
- Nodule Morphology: The bumps appear raised and distinct from the surrounding skin, consistent with the papular and nodular stages of LSD.
- Distribution: The lesions are not localized but are widespread, affecting the neck, torso, and limbs.
- Absence of other specific signs: While mouth ulcers or foot lesions are common in LSD, they are not clearly visible in this specific angle, but the skin lesions are pathognomonic enough for a strong suspicion.

[Care] 4. Immediate First-Aid & Farm Management

- Quarantine/Isolation: Immediately isolate the affected animal from the rest of the herd to prevent transmission, as LSD is highly contagious via vectors like mosquitoes and ticks.
- Hygiene Measures: Disinfect the area where the animal is kept. Use appropriate disinfectants effective against poxviruses.
- Topical First Aid: Apply antiseptic sprays or ointments (like iodine or chlorhexidine) to the open lesions to prevent secondary bacterial infections.
- Supportive Care: Ensure the animal has access to clean water and high-quality feed to support its immune system. Monitor for fever and provide antipyretics if necessary (under veterinary guidance).
- Vector Control: Implement strict insect control measures (mosquito and tick control) in the farm environment to stop the spread to other animals.
